On Introduction of Fuzzy Dualistic Partial Metric Space

C.Revathi Asst. Professor Department of Mathematics Indian Arts & Science College Karianthal – Kondam, Thiruvannamalai – 606 803 Tamilnadu, India

Abstract- In the present paper, we introduced a fuzzy partial metric space using the concepts of fuzzy metric space and partial metric space.

Keywords: Fuzzy point, Fuzzy metric space & Partial metric.

1. Introduction

The concepts of fuzzy sets operations were first introduced by L.A.Zadeh in his classical paper [1] in the year 1965. Thereafter the paper of the C.L.Chang in 1968 paved the way for the subsequent tremendous growth of the numerous fuzzy topological concepts [2]. Since then much attention has been paid to generalize the basic concepts of general topology in fuzzy setting and thus a modern theory of fuzzy topology has been developed.

2. Preliminaries

A fuzzy partial metric space is just a set X equipped with a function p of two variables which measures the distance between points. That is, distance function as defined as a partial metric p in [3], I just motivated it into fuzzy partial metric space.

A fuzzy set in X is called a fuzzy point \Leftrightarrow if it takes the value 0 for any $y \in X$ except one; say $x \in X$ if its value at x is λ ($0 < \lambda \le 1$) .the fuzzy point denoted by σ_x^{λ} where x is called its support.

Definition 1: A fuzzy point in fuzzy topological space (X, T) is a special fuzzy set with Membership function defined by

 $O(x) = \begin{cases} 1 & x = y \\ 0 & x \neq y \end{cases}$, where $0 < \lambda < 1$ is said to have support y, value λ and is denoted by \mathbf{o}_y^{λ} or $O(y, \lambda)$. It complement of the fuzzy point $\overrightarrow{\mathbf{O}_y}$ is denoted by $\overrightarrow{\mathbf{O}_y}$ and $\overrightarrow{\mathbf{O}_y}$ is called crops point.

Definition 2: A fuzzy partial metric on a nonempty set X is a function $p: X \times X \rightarrow [0, \infty)$ such that for all x, y, $z \in X$: (P1)

$$
x = y \Leftrightarrow p(\mathbf{O}_x^a, \mathbf{O}_x^a) = p(\mathbf{O}_x^a, \mathbf{O}_y^b) = p(\mathbf{O}_y^b, \mathbf{O}_y^b) \text{ (P2)}
$$

\n
$$
p(\mathbf{O}_x^a, \mathbf{O}_x^a) \le p(\mathbf{O}_x^a, \mathbf{O}_y^b) \text{ (P3)}
$$

\n
$$
p(\mathbf{O}_x^a, \mathbf{O}_y^b) = p(\mathbf{O}_y^b, \mathbf{O}_x^a) \text{ (P4)}
$$

\n
$$
p(\mathbf{O}_x^a, \mathbf{O}_y^b) \le p(\mathbf{O}_x^a, \mathbf{O}_z^c) + p(\mathbf{O}_z^c, \mathbf{O}_y^b) - p(\mathbf{O}_z^c, \mathbf{O}_z^c)
$$

A fuzzy partial metric space is a pair (X, p) such that X is a nonempty set and p is a fuzzy partial metric on X.

Definition 3: A fuzzy dualistic partial metric on a nonempty set X is a function $p: X \times X \rightarrow (-\infty, +\infty)$ such that for all x, y, z \in X: (P1)

$$
x = y \Leftrightarrow p(\mathbf{O}_x^a, \mathbf{O}_x^a) = p(\mathbf{O}_x^a, \mathbf{O}_y^b) = p(\mathbf{O}_y^b, \mathbf{O}_y^b)
$$

(P2)
$$
p(\mathbf{O}_x^a, \mathbf{O}_x^a) \le p(\mathbf{O}_x^a, \mathbf{O}_y^b)
$$

(P3)
$$
p(\mathbf{O}_x^a, \mathbf{O}_y^b) = p(\mathbf{O}_y^b, \mathbf{O}_x^a)
$$

(P4)

$$
p(\mathbf{O}_{x}^{a},\mathbf{O}_{y}^{b}) \leq p(\mathbf{O}_{x}^{a},\mathbf{O}_{z}^{c})+p(\mathbf{O}_{z}^{c},\mathbf{O}_{y}^{b})-p(\mathbf{O}_{z}^{c},\mathbf{O}_{z}^{c})
$$

A fuzzy dualistic partial metric space is a pair (X, p) such that X is a nonempty set and p is a fuzzy partial metric on X.

Definition 4: A fuzzy weak partial metric on a nonempty set X is a function $p: X \times X \rightarrow [0, \infty)$ such that for all x, y, $z \in X$: (P1)

$$
x = y \Leftrightarrow p(\mathbf{O}_x^a, \mathbf{O}_x^a) = p(\mathbf{O}_x^a, \mathbf{O}_y^b) = p(\mathbf{O}_y^b, \mathbf{O}_y^b)
$$

$$
\begin{array}{ll}\n\text{(P2)} & p(\mathbf{O}_x^a, \mathbf{O}_x^a) \leq p(\mathbf{O}_x^a, \mathbf{O}_y^b) \\
\text{(P4)} & \text{(A)} & \text{(B)} & \text{(C)} & \text{(D)} \\
\text{(E)} & \text{(E)} & \text{(E)} & \text{(E)} & \text{(E)} \\

\text{(E)} & \text{(E)} &
$$

 $p(\overrightarrow{O}_{x}^{a}, \overrightarrow{O}_{y}^{b}) \leq p(\overrightarrow{O}_{x}^{a}, \overrightarrow{O}_{z}^{c}) + p(\overrightarrow{O}_{z}^{c}, \overrightarrow{O}_{y}^{b}) - p(\overrightarrow{O}_{z}^{c}, \overrightarrow{O}_{z}^{c})$ A fuzzy weak partial metric space is a pair (X,

p) such that X is a nonempty set and p is a fuzzy weak partial metric on X.

Example: The pair
$$
(R^+,p)
$$
, where $p(\overline{O}_x^a, \overline{O}_y^b) = \text{Max}\{x, y\}$ for all $x, y \in R^+$.

Definition 3: An open ball for a fuzzy partial metric $p: X \times X \rightarrow [0, \infty)$ is a set of the form, $\mathbf{B}_{\varepsilon}^{\mathbf{p}}(x) = \{y \in X / p(\mathbf{O}_{x}^{\mathbf{a}}, \mathbf{O}_{y}^{\mathbf{b}}) < \varepsilon\}$ for each $\varepsilon > 0$, $x \in X$. Note that, unlike their metric counterparts, some fuzzy partial metric open balls may be empty. For example, if a a $p(\mathbf{o}_x^a, \mathbf{o}_x^a) > 0$, then $\mathbf{B}_{p(\mathbf{o}_x^a, \mathbf{o}_x^a)}^p$ $B_{p(Q_x^a,Q_x^a)}^p(x) = \phi.$

Theorem 1: The set of all open balls of a fuzzy partial metric $p: X \times X \rightarrow [0, \infty)$ is the basis of a fuzzy topology T[p] over X.

Proof:

As,
$$
X = \bigcup_{x \in X} B^P_{P(O_x^*O_x^*)+1}(x)
$$
 and for any balls
\n $B_\epsilon^P(x)$ and $B_\delta^P(y)$
\n $B_\epsilon^P(x) \cap B_\delta^O(y) = \bigcup \{B_\eta^P(z) / z \in B_\epsilon^P(x) \cap B_\delta^P(y)\}$

Where,

$$
\eta {=} p(_{O_Z^c O_Z^c}^c) {+} min\{\epsilon {-} p(_{O_X^a,O_Z^c}^c), \delta {-} p(_{O_Y^b,O_Z^c}^c)\}
$$

Theorem 2: For each fuzzy partial metric p, open ball $\mathbf{B}_{\varepsilon}^{\mathbf{p}}(a)$, and $x \in \mathbf{B}_{\varepsilon}^{\mathbf{p}}(a)$, there exists $\delta > 0$ such that $x \in B_{\delta}^{p}(x) \subseteq B_{\delta}^{p}(a)$.

Proof:

Suppose $x \in B_c^p(a) \Rightarrow p(\mathbf{o}_x^a, \mathbf{o}_x^a)$ $x \in \mathbf{B}_{\varepsilon}^{\mathbb{P}}(a) \Rightarrow p(\mathbf{O}_{x}^{a}, \mathbf{O}_{a}^{a}) < \varepsilon$ Let

Let
\n
$$
\delta = \varepsilon - p(o_x^a, o_a^a) + p(o_x^a, o_x^a) \Longrightarrow \delta > 0 \text{ as } \varepsilon > p(o_x^a, o_{\mathbf{w}}^a) \text{ here } \varepsilon = (p(o_{x}^a, o_{x}^a) + p(o_{x}^a, o_{y}^b))/2.
$$

Also

 $p(o_x^a, o_x^a) < \delta$ as $\varepsilon > p(o_x^a, o_a^a)$ Thus $x \in B_{\delta}^{p}(x)$ Suppose now that $y \in \mathbf{B}_{\delta}^{\mathbb{P}}(x)$ $\therefore p(o_y^b, o_x^a) < \delta$ $\therefore p(o_y^b, o_x^a) < \varepsilon$ by (P4) \therefore y \in $\mathbf{B}_{\varepsilon}^{p}(x)$ Thus $B_s^p(x) \subseteq B_s^p(a)$.

Using the last result it can be shown that each sequence $A_n \in X^\omega$ convergence to an object $a \in X$ if and only if \blacksquare ' \blacksquare ' \blacksquare ' \blacksquare ' \blacksquare n a a a a a $\lim_{n \to \infty} p(\overline{O}_{A_n}^a, \overline{O}_a^{a'}) = p(\overline{O}_a^{a'}, \overline{O}_a^{a'})$.

Definition 4: Fuzzy topological space (X, T) is called a fuzzy T_0 space if and only if for any fuzzy points x and y such that $x \neq y$, either

 $x \notin y$ or $y \notin x$ - 10 and 10

Theorem 3: Each fuzzy partial metric is fuzzy T_0 .

Proof:

Suppose $p: X \times X \rightarrow [0, \infty)$ is fuzzy partial metric and suppose $x \neq y \in X$, then, from (P1) & (P2) which implies $p(\mathbf{o}_x^a, \mathbf{o}_x^a) \le p(\mathbf{o}_x^a, \mathbf{o}_y^b)$ So far we have shown that fuzzy partial metric p can quantify the amount of information in an object x using the numerical measure a a $p(\mathbf{o}_x^a, \mathbf{o}_x^a).$
